ABSTRACT

Background: The word Vata derived from the verbal root ‘Và’ meaning is Gati and Gandhana. Vata is responsible for Gati (movement), Jnana (knowledge or perception) and Prapti (obtaining or receiving).

Aims & Objectives: To critically analyze the physiological points emphasized in the derivation of Vata Dosha by considering the vomiting reflex.

Materials & Methods: The Ayurvedic classics were scrutinized regarding the references for derivation of Vata Dosha. Later, physiologico-anatomical aspects of the vomiting with reference to reflexes were studied from modern physiology books. Later, supportive correlation was done between Ayurvedic and modern views to build valid and reliable hypothesis regarding derivation of Vata dosha in relation to the various anatomical and physiological aspects of the reflexes.

Discussion & Conclusion: Physiological importance is emphasized in the word Gamana, Gnyana, Prapti. Prapti refers to physiology of receiving the impulses from the stimulus and receiving the motor response by the effector organ. Gamana refers to movement of impulses from sensory nerve to vomiting center and from vomiting center to effector organ even it signifies the reverse perstalsis and opening up of oesophageal sphincters, closure of glottis. Gnyana refers to perceiving of the sensory impulses and generating appropriate response by the vomiting center.

Keywords: Gamana, Gnyana, Prapti, Vomiting, Physiology.

INTRODUCTION

The five basic elements exist in all matter. Water provides the classic example: - the solids of iced water are manifestation of the Prithvi Mahabhuta (earth principle). Latent heat in the ice (Agni) liquefies it, manifesting into Jala Mahabhuta (water principle)\(^1\). And then eventually it turns into steam expressing the Vayu Mahabhuta (air principle) the steam disappears into Akasha or space\(^2\). Bhuta is that which is not born out of something, but out of which something is born. It is the material cause of substances in the world. When we say Bhuta we mean that subtle level of existence, where as Mahabhuta refers to gross level of existence\(^3\). Panchikarana is the process through which invisible Bhutas combine with each other and form the visible Mahabhutas in such a way that all Bhutas are present together in each Drisya Bhuta in varying degrees of predominance. Thus in the physical world everything is a combination of Pancha Mahabhutas & we cannot see them independently\(^4\).

Thus the five basic elements Akasha, Vayu, Teja, Jala And Prithvi are present in one substance. This proves that all five elements are present in all matter in the universe\(^5\). Visualization of the identity of the individual with the universe paves the way for salvation. The body is described as the modified form of Mahabhutas hence the description of the identity of the individual & the universe relates to Mahabhutic composition only. The multitudes of the human features are ascribed to the proportion of different Bhutas each of different nature.

The balance of Dosha represents the healthy state and imbalance will cause various diseases. In normalcy Doshas will be performing their own functions and individual Doshas will be having their own specific sites. The word Vata derived from the verbal root ‘Va’ meaning is Gati and Gandhana. Vata is responsible for Gati (movement), Jnana(knowledge or perception) and Prapti(obtaining or receiving)\(^6\). Word meaning of Vata in derivation suggest the physiological functioning of Vata in the body in different dimensions. Brief Physio- anatomical understanding of the vomiting reflex is necessary to understand physiological points emphasized in the derivation of Vata Dosha.
Vomiting is always preceded by nausea. Nausea is unpleasant sensation which induces the desire for vomiting. It is characterized by secretion of large amount of saliva containing more amount of mucus. Strong involuntary movements in the GI tract which start even before actual vomiting. These movements intensify the feeling of vomiting. This condition is called retching (try to vomit) and vomiting occurs few minutes after this. Beginning of antiperistalsis, which runs from ileum towards the mouth through the intestine, pushing the intestinal contents into the stomach within few minutes. Velocity of the antiperistalsis is about 2 to 3 cm/second. Deep inspiration followed by temporary cessation of breathing. Followed by Closure of glottis. Upward and forward movement of larynx and hyoid Bone, Elevation of soft palate. Contraction of diaphragm and abdominal muscles with a characteristic jerk, resulting in elevation of intra-abdominal pressure. Compression of the stomach between diaphragm and abdominal wall leading to rise in intragastric pressure. Simultaneous relaxation of lower esophageal sphincter, esophagus and upper esophageal sphincter. Forceful expulsion of gastric contents (vomitus) through esophagus, pharynx and mouth. Movements during act of vomiting throw the vomitus (materials ejected during vomiting) to the exterior through mouth. Some of the movements play important roles by preventing the entry of vomitus through other routes and thereby prevent the adverse effect of the vomitus on many structures. Such movements are: Closure of glottis and cessation of breathing prevents entry of vomitus into the lungs, Elevation of soft palate prevents entry of vomitus into the nasopharynx, Larynx and hyoid bone move upward and forward and are placed in this position rigidly. This causes the dilatation of throat, which allows free exit of vomitus. Vomiting is a reflex act. Sensory impulses for vomiting arise from the irritated or distended part of GI tract or other organs and are transmitted to the vomiting center through vagus and sympathetic afferent fibers. Vomiting center is situated bilaterally in medulla oblongata near the nucleus tractus solitarius. Motor impulses from the vomiting center are transmitted through V, VII, IX, X and XII cranial nerves to the upper part of GI tract; and through spinal nerves to diaphragm and abdominal muscles.

**AIM AND OBJECTIVES**

To critically analyze the physiological points emphasized in the derivation of Vata Dosha by considering the vomiting reflex.

**MATERIALS AND METHODS**

The Ayurvedic classics were scrutinized regarding the references for derivation of Vata Dosha. Later, physiologico-anatomical aspects of the vomiting with reference to reflexes were studied from modern physiology books. Later, supportive correlation was done between Ayurvedic and modern views to build valid and reliable hypothesis regarding derivation of Vata dosha in relation to the various anatomical and physiological aspects of the reflexes.

**DISCUSSION**

Strong involuntary movements in the GI tract which start even before actual vomiting. These movements intensify the feeling of vomiting. This condition is called retching (try to vomit) and vomiting occurs few minutes after this. Beginning of antiperistalsis, which runs from ileum towards the mouth through the intestine, pushing the intestinal contents into the stomach within few minutes. Velocity of the antiperistalsis is about 2 to 3 cm/second. Deep inspiration followed by temporary cessation of breathing. Followed by Closure of glottis. Upward and forward movement of larynx and hyoid Bone, Elevation of soft palate. Contraction of diaphragm and abdominal muscles with a characteristic jerk, resulting in elevation of intra-abdominal pressure. Compression of the stomach between diaphragm and abdominal wall leading to rise in intragastric pressure. Simultaneous relaxation of lower esophageal sphincter, esophagus and upper esophageal sphincter. Forceful expulsion of gastric contents (vomitus) through esophagus, pharynx and mouth. Movements during act of vomiting throw the vomitus (materials ejected during vomiting) to the exterior through mouth. Vata is responsible for Gati (movement), Jnana(knowledge or perception) and Prapti(obtaining or receiving).

Physiological importance emphasized in the word Prapti of Vata Dosha derivation can be understood as Receiving (Prapti) of the sensory stimulus by the sensory nerve endings present in the GI tract. Physiological importance emphasized in the word Gamana of Vata Dosha derivation can be understood as Impulses from the nerve endings are transmitted via afferent fibers to the vomiting center and higher centres of vomiting. The center in turn, sends motor impulses to the primary and accessory muscles of respiration via efferent nerve fibers. Physiological importance emphasized in the word Gnyana(knowledge, perception) of Vata Dosha derivation can be understood as Perceiving the impulses and generating the appropriate response by the vomiting center. Physiological importance emphasized with reference to motor part in the word Gamana of Vata Dosha derivation can be understood as reverse peristalsis, relaxation of oesophageal sphincters and closure of respiratory pathway.

**CONCLUSION**

The Physiological importance is emphasized in the word Gamana, Gnyana, Prapti. Prapti refers to physiology of receiving the impulses from the stimulus and receiving the motor response by the effector organ. Gamana refers to movement of impulses from sensory nerve to vomiting center and from vomiting center to effector organ even it signifies the reverse peristalsis and opening up of oesophageal sphincters, closure of glottis. Gnyana refers to perceiving of the sensory impulses and generating appropriate response by the vomiting center.
